

Service and solutions that provide better data and better information for better business.

Data Warehouse and Business Intelligence Development

Building, deploying and operating a data warehousing solution is unlike standard OLTP applications. Realizing this, XCURA has developed a method for data warehouse and business intelligence development. A method based on iterative evolutionary steps covering all aspects of the data warehousing environment.

The focus is on data, processes, people and technology as it relates to all the components that comprise the solution. For the standard data warehousing architecture each component is addressed in the development life cycle.

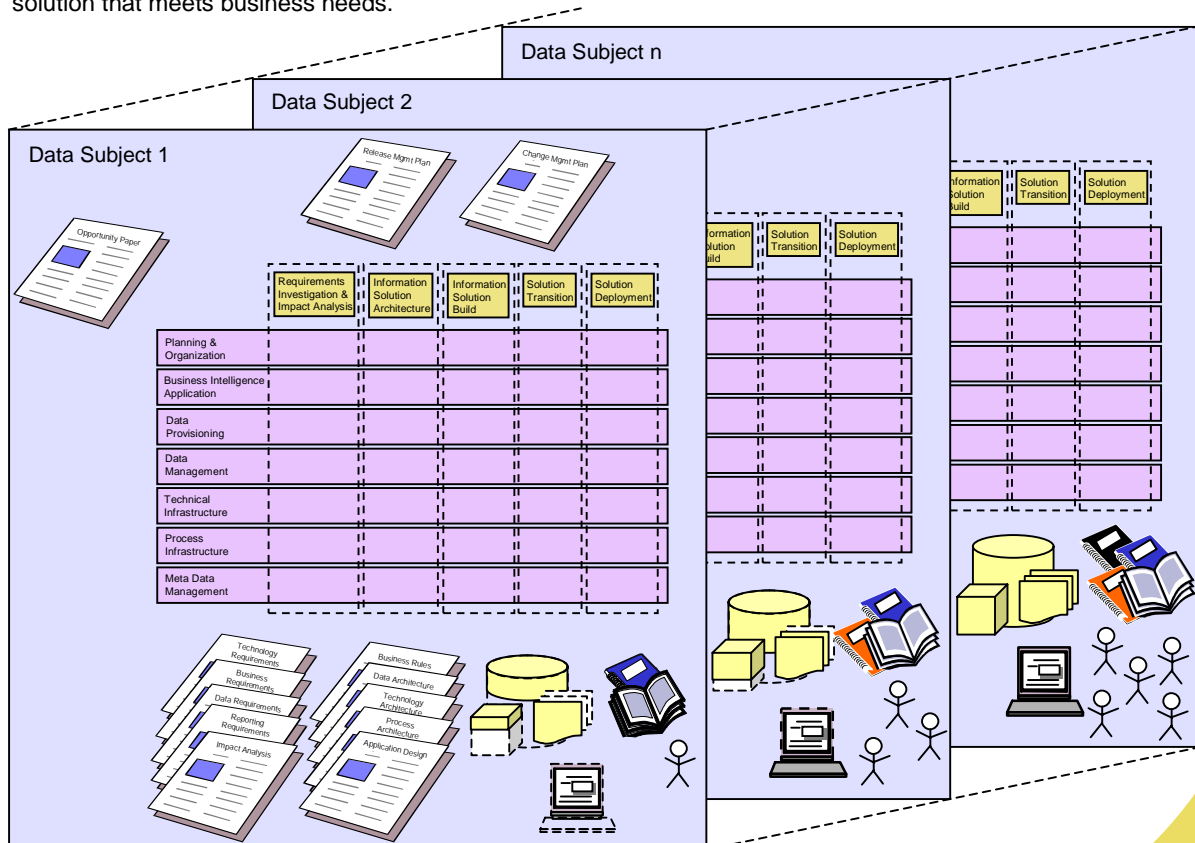

Business and Information Opportunity Analysis
Requirements Definition
System & Business Architecture
System Development & Testing
Infrastructure Development
Training & Deployment
Release & Change Management

For solutions large or small, XCURA can provide the guidance and execution to meet your business information needs. XCURA boasts a team of specialists with an average of 8 years of data warehousing and business intelligence experience. We deliver solutions on all major DBMS platforms and leading edge business intelligence and meta data tools.

A Method for Success

The XCURA methodology for development is based on five phases covering seven disciplines. The first three phases are iterative allowing for flexibility and accepting the complex nature of data. Each of the seven disciplines is a 'track' of activities that operate in conjunction with other tracks yet permit work lead or lag, providing responsiveness to business change and an accurate solution that meets business needs.
